

INTELLIGENT EXCEPTION ROUTING VIA GEMINI 2.5 FLASH & UIPATH

Semantic AI Analysis	Human-in-the-Loop Validation	Asynchronous Closed Loop
Gemini 2.5 Flash acts as the core logical brain of the pipeline.	Structural discrepancies or low-confidence extractions automatically trigger a validation event.	Manual submission immediately fires a cloud-native webhook back to the Orchestrator.
Contextually compares extracted unstructured PDF values against internal spreadsheet tables.	Robot generates a side-by-side verification interface natively within UiPath Action Center .	Task is securely logged into the Completed audit trail for enterprise compliance.
Dynamically handles complex matching rules without relying on rigid, brittle hardcoding.	Prevents silent automation failures by safely escalating edge cases to a supervisor.	The robot instantly unpauses to seamlessly execute down-funnel ERP data entry.

To make our automation truly enterprise-grade, we didn't want a bot that would simply crash or fail silently when encountering mismatched data. Instead, we built an Intelligent Human-in-the-Loop architecture.

As you can see on the slide, Gemini 2.5 Flash sits at the center of our canvas, acting as the semantic brain to cross-reference our data. When a discrepancy is flagged, the robot gracefully steps aside and generates a structured, high-visibility task within UiPath Action Center. > A supervisor can review the exact invoice side-by-side with the extraction data, correct any anomalies, and hit submit. This instantly triggers a secure cloud webhook, logging the action for an immutable audit trail and signaling the robot to safely complete its job. We have effectively combined the processing speed of AI with the strategic oversight of human decision-making."

NATIVE ACTION CENTER INTERFACE MOCKUP

ACTION REQUIRED: Verify Invoice Discrepancy | FRAUD RISK: 85/100

AI Timeline Context: "Warning: Line item 'ThinkPad X1' has surged 20% against master PO agreement."
